

Does your child have Angelman syndrome?

If your child has Angelman syndrome consider participating in the NEPTUNE study.

NEPTUNE is a pediatric clinical study that is evaluating **OV101** to determine if the investigational medicine changes the severity of symptoms, such as the ability to sleep, use of gross and fine motor skills, behavior and communication.

Study participation should last approximately 4 to 5 months.

To be eligible, your child must meet these initial criteria:

1

Be between the ages of 2 and 12*

2

Have a confirmed diagnosis of Angelman syndrome

3

Have fewer than 3 seizures lasting less than 3 minutes weekly

To learn if your child may qualify to participate in **NEPTUNE**, contact Dr. Keary's research team at **781-860-1711** or email **LurieCenterResearch@partners.org**.

**Study enrollment will start with ages 9-12 and then enroll ages 4-8.*
