PTEN Hamartoma Tumor Syndromes: Cowden Syndrome

Information for families with a pathogenic variant in the PTEN gene

The purpose of this handout is to give you detailed information about your genetic test result which you may read and discuss with your medical providers. Researchers will continue to study the PTEN gene, so please check in with your medical providers once a year to learn of any new information that may be important for you and your family members. (Please see the last page for a glossary of medical terms which are underlined in this document.)

You have a pathogenic variant in the PTEN gene, and a diagnosis of Cowden syndrome.

What is hereditary cancer?

- Cancer is a common disease. One out of every 3 people in the United States will develop some type of cancer in his or her lifetime.

- About 5-10% of cancers (up to 1 in 10) are hereditary. A hereditary cancer occurs when a person is born with a pathogenic variant (also known as a mutation) in a gene that increases the chance to develop certain types of cancer. A pathogenic variant can be passed on from one generation to the next.

- Typically, families with Cowden syndrome have one or more of the following features:
  - Breast cancer in women
  - Thyroid cancer and nodules
  - Endometrial cancer
  - Gastrointestinal polyps
  - Macrocephaly (large head size)
  - Specific skin findings
  - Individuals with more than one of these features
  - Multiple family members with cancers and/or other features of Cowden syndrome

What is a pathogenic variant?

- DNA is our genetic material which is passed on from parent to child. It contains the instructions for how our bodies develop, grow, and function. A gene is a small piece of DNA which has a specific job to do in the body. Some genes determine features like eye color or height, while other genes are involved with our health.

- We all have variations in our genes that make us different from one another. Most of these variations do not change the way our genes work. However, some variations do prevent a gene from working correctly. This type of variation is called a pathogenic variant or mutation.

Why does having this pathogenic variant cause an increased risk for cancer?

- The job of the PTEN gene is to prevent cancer. It is called a tumor suppressor gene. When working correctly, tumor suppressor genes help to prevent cancer by controlling the growth and division of cells.

- People born with a PTEN pathogenic variant have only one working copy of the PTEN gene, so their risk for cancer is higher than average.

What are the cancer risks linked to this pathogenic variant?

- People with Cowden syndrome have higher risks for certain types of cancer which are outlined in the table below.
Table: Lifetime Cancer Risk (chance to get cancer at any time during life)

<table>
<thead>
<tr>
<th>Cancer type</th>
<th>People who do not have a pathogenic variant</th>
<th>People with Cowden syndrome</th>
</tr>
</thead>
<tbody>
<tr>
<td>Female breast cancer</td>
<td>10-12%</td>
<td>25-50%</td>
</tr>
<tr>
<td>Endometrial (uterine) cancer</td>
<td>2-3%</td>
<td>5-10%</td>
</tr>
<tr>
<td>Thyroid cancer (typically follicular)</td>
<td>1%</td>
<td>3-10%</td>
</tr>
<tr>
<td>Colorectal cancer</td>
<td>4-5%</td>
<td>9-16%</td>
</tr>
<tr>
<td>Renal cell cancer</td>
<td>1-2%</td>
<td>Possibly increased</td>
</tr>
<tr>
<td>Melanoma</td>
<td>2%</td>
<td>Possibly increased</td>
</tr>
</tbody>
</table>

- People with Cowden syndrome can also have benign (non-cancerous) tumors and other physical features such as:
  - Colon and gastrointestinal polyps: hamartomas and ganglioneuromas, >90% of patients
  - Benign thyroid lesions, 30-68% of patients
  - Benign brain tumor: Lhermitte-Duclos disease (LDD), ~30% of patients
  - Large head size: macrocephaly, >80% of patients
  - Skin findings: macular pigmentation of the glans penis, trichilemmomas, acral keratoses, mucocutaneous neuromas, and oral papillomas

- The numbers above are shown as a range. This is because not all families/individuals have the exact same degree of risk. Risks may be affected by the environmental factors, lifestyle, personal medical history, family cancer history, and other genetic or unknown factors.

Is it possible to fix the pathogenic variant?
Unfortunately, it is not yet possible to fix a pathogenic variant in the PTEN gene. However, it is possible to change your medical care and certain things in your lifestyle. Your provider(s) will work with you to discuss these options and create a medical care plan that is right for you.

What are the medical care recommendations?
The medical care recommendations for people with Cowden syndrome focus mainly on surveillance and surgery.

Surveillance:
The purpose of surveillance (also referred to as ‘screening’) is to diagnose cancer at as early a stage as possible. Although scientists and physicians can’t prevent a cancer from developing, early detection is important. When a cancer is detected early, it is more likely to be treated successfully. There are very good surveillance methods for some, but not for all types of cancer.

The table below outlines surveillance recommendations for individuals with a PTEN pathogenic variant (adapted from the National Comprehensive Cancer Network Genetic Breast, Ovarian, and Pancreatic Guideline, Version 2.2021). Please note that these are general guidelines. Specific guidelines for individual patients and families may differ.

<table>
<thead>
<tr>
<th>Cancer type</th>
<th>Surveillance recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thyroid cancer</td>
<td>Thyroid ultrasound yearly, beginning at age 7</td>
</tr>
<tr>
<td>Colon cancer/polyps</td>
<td>Colonoscopy every 5 years, beginning at age 35 (younger and/or more frequently, based on family history)</td>
</tr>
<tr>
<td>Kidney cancer</td>
<td>Kidney ultrasound every 1-2 years, beginning at age 40</td>
</tr>
</tbody>
</table>
Breast cancer (females) | Regular monthly breast self-examinations beginning at age 18  
Clinical breast exam every 6-12 months, beginning at age 25 (or earlier based on family history).  
Yearly mammogram, with tomosynthesis if available, and breast MRI screening with contrast starting at age 30-35 (or earlier based on family history).

Endometrial cancer | No proven benefit to screening. Consider endometrial biopsy every 1 to 2 years. Prompt response to symptoms (e.g. abnormal bleeding).

Other recommendations | Complete yearly physical exam.  
Consider yearly dermatology exam.  
Consider psychomotor assessment and brain MRI in children.  
Education regarding signs and symptoms of cancer.

Risk-reducing surgery options:
The goal of risk-reducing surgery is to reduce the risk of cancer by removing healthy tissue before cancer develops. This is also called prophylactic surgery. Risk-reducing surgery does not eliminate the chance to get cancer, but it does greatly lower the chance.

- **Hysterectomy**: This surgery removes the uterus to lower the risk of endometrial cancer (cancer of the lining of the uterus). Hysterectomy should be discussed with all women who carry a *PTEN* pathogenic variant. Women who are planning to have children may consider this surgery when they are done having children.

- **Prophylactic bilateral mastectomy (PBM)**: This surgery removes the healthy breast tissue to lower the chance for breast cancer by more than 90%. Women considering PBM may have questions about their options for breast reconstruction (the rebuilding of the breast mounds through implants or tissue) which can be discussed with a specially trained breast surgeon. Because there are effective breast cancer surveillance tools, women who carry *PTEN* pathogenic variants may choose surveillance as an acceptable alternative to PBM. Deciding between PBM and surveillance is a very personal decision, so it is important to carefully consider the benefits and drawbacks of each option, which may be discussed with specially trained medical providers.

Who should I see for my medical care?
It is important to find health care providers you trust for long-term follow-up care. Your primary care providers may be able to provide some of this care. In some cases, you may need to see specially trained medical providers. We are happy to provide you with referrals to specialists at Mass General as needed.

How can I live a healthy lifestyle to lower my risk of developing cancer?
Everyone should follow a healthy lifestyle, but this may be even more important for someone with an increased risk of cancer. According to the American Cancer Society, a healthy lifestyle includes:

- Avoiding tobacco.
- Maintaining a healthy weight.
- Participating in regular physical activity.
- Keeping a healthy diet with plenty of fruits and vegetables.
- Limiting yourself to no more than 1-2 alcoholic drinks per day.
- Protecting your skin and eyes from the sun.
- Knowing your own body and medical history, your family history, and your risks.
- Having regular check-ups and cancer screening tests.

What are the chances that my family members also have the pathogenic variant?

- **Your children**: Each of your children has a 50% chance to inherit the normal (working) copy of the *PTEN* gene and a 50% chance to inherit the *PTEN* pathogenic variant (the non-working copy). There may be a risk for childhood tumors in patients with *PTEN* pathogenic variants and genetic testing for...
minors should be considered. Ask your genetic counselor if you have specific questions regarding your children.

- **Your siblings and other relatives:** In most cases, brothers and sisters of a person with a *PTEN* pathogenic variant have a 50% chance to have the same pathogenic variant. Additionally, other family members (such as parents, cousins, aunts, uncles) may also be at risk to have the pathogenic variant.

- **Family planning:** People with *PTEN* pathogenic variants may have concerns about passing a *PTEN* pathogenic variant to a child. There are reproductive options that can be used to lower the chance of passing a *PTEN* pathogenic variant to a child. If you are interested in learning more about these options, please contact your genetic counselor for a referral.

The letter you received from your genetic counselor will give more specific recommendations about which relatives are candidates for genetic testing. However, please feel free to contact us with any further questions.

**Where can I find additional information?**
Feel free to contact us if you have any questions or would like additional resources. Some people find it useful to speak with other people with *PTEN* pathogenic variants who have similar concerns. We would be happy to arrange this for you if you are interested.

Glossary of cancer genetics terms:

- **Cell**: The basic structural and functional unit of any living thing. Each cell is a small container of chemicals and water wrapped in a membrane. The human body is made up of 100 trillion cells forming all parts of the body such as the organs, bones, and blood.

- **DNA**: Deoxyribonucleic acid, or DNA, is the genetic material that is passed on from parent to child, which gives the instructions for how our bodies develop, grow, and function on a daily basis.

- **Early detection**: The process of finding cancer when it is just starting to develop.

- **Gene**: A gene is a small piece of DNA that gives instructions for a specific trait.

- **Inherited trait**: A character or feature that is passed on from a parent to a child.

- **Lifetime cancer risk**: The chance that a person will develop cancer in his or her life. This is sometimes defined as the chance of developing cancer by the age of 75 or 80.

- **Pathogenic variant**: A change in a gene that prevents it from working correctly. Also called a mutation.

- **Risk-reducing surgery**: Surgery to remove healthy tissue or organs before cancer develops. Also called prophylactic surgery.

- **Surveillance**: Screening tests or procedures to look for early signs of cancer development or cancer returning (recurrence).

- **Syndrome**: A set of signs and symptoms that appear together and characterize a disease or medical condition.

- **Tumor suppressor gene**: When working correctly, tumor suppressor genes prevent cancers from developing by controlling the growth of cells.
