Investigation of Neuroinflammation in Autism using MR-PET

Are you a healthy man between 18 and 40 years old?

You may be eligible for a Massachusetts General Hospital research study investigating the structure and function of the brain of adults with and without autism spectrum disorders using MR-PET scans. The study includes one screening visit at the MGH Lurie Center, will include training and two scanning visits at the MGH Martinos Center for Biomedical Imaging. Eligible participants will be compensated for their time.

For more information, please contact Lurie Center research staff at:

(781) 860-1711
