The Pediatric Bone and Mineral Metabolism Disorders Clinic at MassGeneral Hospital for Children (MGHfC) is a sub-specialty area of excellence within the divisions of Pediatric Endocrinology and Pediatric Nephrology that provides clinical care for infants, children and young adults with disorders that affect bone health and mineral metabolism.

We collaborate with pediatric and adult specialists from departments throughout MGHfC and Massachusetts General Hospital, including Pediatric Orthopaedics, Adolescent Medicine and Pediatric Gastroenterology. Providers from Genetics, Pediatric Neurology and Physical Therapy provide consults as needed. Our clinic also facilitates a seamless transition from pediatric to adult care for older adolescents to ensure ongoing care for their bone health.

Please call 888-644-3248 to schedule an appointment or refer a patient. | Visit www.massgeneralforchildren.org/bone-and-mineral to learn more.
