Diabetes Medicines: Pills

Diabetes pills are not for everyone with diabetes. People with type 1 diabetes must use insulin and many people with type 2 diabetes take insulin to treat their diabetes. However, many people with type 2 diabetes can manage their diabetes with pills, or pills and insulin.

It is important to know the name of your diabetes medicine, how it is taken, the reasons for taking it, and possible side effects. Diabetes pills work in different ways and may be used together. The goal is to help control your blood sugar.

Some pills:
- Stop your liver from releasing too much sugar
- Help your pancreas to make more insulin
- Help your body better use your insulin
- Slow the digestion of some carbohydrates

When should I call my healthcare provider?
- If you have very low or very high blood sugars
- If you are concerned about any new side effects
- If you stop taking your pills for any reason

What may affect how my pills work?
- Alcohol
- Over-the-counter medications
- Herbal preparations

Steps To Better Health
- Take your pills at the right time every day
- Eat at regular meal times
- Keep a list of your medications in one place and keep it up to date
- Check your list of medications with your healthcare provider at every visit
Oral Medications (Pills) for Type 2 Diabetes

There are five classes of pills and several combinations of these pills for people with type 2 diabetes. Each has a different way of helping you control your diabetes. Your healthcare provider will decide which pills are best for you.
